

ABSTRACT

Faceted cutting tips or forward leading ends of arrowheads having a sharp cutting edge at the juncture of adjoining facets. A bevel or bevels substantially follow(s) the contour of each cutting edge and is disposed adjacent each respective cutting edge. The facets may have at least portions thereof concave, convex or flat, as well as may the corresponding bevel(s). The structural facet integrity of the cutting tip is retained so as to sufficiently crush/split heavy bone and push penetrated material easily from its cutting path, while concomitantly slicing soft tissue with the ease of a razor edge.
